"Identification and characterization of the products from the trady and trary genes of plasmid R100.",
-i. Bacteriol. 170:2749-2757(1988).
-i. FUNCTION: TRANSFER GENE PROTEIN. IS INVOLVED IN THE CONJUGATION PROCESS OF BACTERIAL GELLS FOR THE EXCHANGE OF PLASMID DNA.
-i. SUBCELLULAR LOCATION: Cytoplasmic.
-i. SIMILARITY: Belongs to the tram family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

-!- MISCELLANBOUS: These peptides are released from mast cells in lung (and other tissues) during hypersensitivity reactions (anaphylaxis). Their activities, preferentially affecting eosinophils, include chemotaxis, chemotactic deactivation, release of enzymes, and stimulation of the hexose monophosphate shunt. GO; GO:0006935; P:chemotaxis, IDA.

VARIANT

| V -> A (IN OTHER PEPTIDE).

| FITId=UAR 005201.
| FITIG=UAR 005201.
-!- FUNCTION: Neuroexcitatory peptide, increases the impulse frequency and produces a spike broadening of the identified heart excitatory neuron (PON); also enhances the amplitude and frequency of the heart heat. Has also an effect on several other muscles.

"The expansion behaviour of sea anemones may be coordinated by two inhibitory neuropeptides, Antho-Kaamide and Antho-Riamide.";
Proc. R. Soc. Lond., B. Biol. Sci. 253:183-188 (1993).
-!-FUNCTION: Inhibits spontaneous contractions in several muscle groups. May be involved in the expansion phase of feeding behaviour in sea anemones.
-!- SUBCELIULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Neuron specific.
Neuropeptide; Amidation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MEDLINE=20336815; PubMed=10876044; Iwakoshi E., Hisada M., Minakata H.; Iwakoshi E., Hisada M., Minakata H.; "Caradioactive peptides isolated from the brain of a Japanese octopus, Octopus minor.";

Novel pigment protein derived from corals capable of emitting fluorescence upon irradiation by incident light useful as tissue marker, fluorescent marker or general dyestuff.

Claim 3; Page 42; 49pp; English.

The N-terminal peptides shown in AAY97147-48 are from pigment protein from coral tissue (PPCT). PPCT is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-660 nm and a maximal fluorescence emission is in the range of 330-700 nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dysetuff (all claimed). PPCT may also be used in sunscreen formulations or UV filters

(biomatrix). The first all-protein

Comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

transgenic animal which exhibits a novel colour e.g. sheep with blue or

red coloured fleece. They are useful for producing coloured plant

catracts, e.g. flavouring, beverage or juice or colouring agent. Other

uses include transducing or intensifying an image, providing additional

light for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

upholstery. CFMs are useful in the flower inductry, in the development of

new varieties of flowering plants. Other contemplated uses include,

expression markers, general reporter molecules, photon traps, UV sinks or

in sunscreens. CFMs modify visible colour in edible and/or ornamental

fungal species, and in fruits and vegetables to enhance their

marketability. CFMs embedded in a gel matrix improve image quality in
                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-

The yeast PPIase has a single mol. wt. of about 17 kba and a single isoelectric point of about 6.2. The enzyme catalyses the isomerisation of prolyl peptide bonds in proteins and accelerates the folding of the protein. The inventors are claiming a PPIase-beta. (Updated on 25-MRR-2003 to correct PN field.) (Updated on 25-MRR-2003 to correct PN field.) (Updated on 15-MRR-2003 to n 16-OCT-2003 to standardise OS field)

AAR72877-85 are tryptic fragments of a yeast PPIase (peptidyl prolyl cistrans isomerase). The yeast PPIase has a single mol. wt. of about 17 kba and a single isoelectric point of about 6.2. The enzyme catalyses the isomerisation of prolyl peptide bonds in proteins and accelerates the folding of the protein. The inventors are claiming the PPIase-alpha. (Updated on 25-MAR-2003 to correct PM field.) (Updated on 25-MAR-2003 to correct PM field.) (Updated on 25-MAR-2003 to not 05-MAR-2003 to correct PM field.) (Updated on 15-MAR-2003 to correct PM field.) (Updated on 16-OCT-2003 to standardise 05 field)
                                                                                                                                                                                                                                                                                                                                                                                                                                         New B.coli peptidyl prolyl cis trans isomerase alpha - used to accelerate the folding of proteins, partic. for activation of inactive recombinant proteins.
                                                             Bscherichia coli; protein conformation; folding; acceleration;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAR72921-29 are tryptic fragments of a yeast PPIase (peptidyl prolyl cistrans isomerase). The yeast PPIase has a single mol. wt. of about 17 kDa and a single isoelectric point of about 6.2. The enzyme catalyses the isomerisation of prolyl peptide bonds in proteins and accelerates the folding of the protein. The inventors are claiming a PPIase-beta. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to orrect PF field.) (Updated on 25-MAR-2003 to correct PF field.) (Updated on 15-MAR-2003 to standardise OS field)

The inventors claim recombinant penicillin acyltransferase (PAT) and DNA coding for PAT. PAT catalyses the last step in the biosynthesis of penicillin G and penicillin V. More specifically, the coding strand of the DNA has the nucleotide sequence shown below. This includes three introns and codes for a PAT protein with mol. wt. ca. 40kD. Plasmid vectors pBC2001 and pBC2002 are specifically claimed
  released). The method is useful in quantifying the actual amount of 1 or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence of fragment 19, the tryptic fragment of recombinant penicillin acyltransferase (PAT) polypeptide 2.
                  more selected polypeptides in a sample, which may be important in research settings (e.g. in drug discovery and development) and in clinical settings (e.g. for medical diagnosis and for monitoring treatment efficacy). The present sequence is a peptide used to demonstrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Recombinant penicillin acyl-transferase - and DNA coding for it.
                                                                                                                                                                         Score 16; DB 7; Length 5;

New de-acetylase specific for L-N-acetyl-phosphinothricin - isolated from soil microbes, useful for stereoselective prodn. of L-phosphinothricin and for making male-sterile plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   deacetylase has a molecular weight of 20000-100000, an optimum pH of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          6.5-9.5 and substrate specificity for L-N-acetylphosphinothricin (L-Acetylphosphinothricin (L-Acetylphosphinothricin (L-Acetylphosphinothricin (L-Stepselective production of L-phosphinothricin (PPT) and for inducing reversible male scrility in plants (PPT inhibits the enzyme glutamine synthase in anthers). The deacetylase comprises at least one of four sequences (See AAR61321-24) (Updated on 2s-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; secreted protein, treatment, prevention, protein therapy, AIDS; gene therapy; diagnosis; cancer; tumour; neurodegenerative disorder; developmental abnormality; fetal deficiency; blood disorder; leukemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

This invention describes novel isolated human genes and the secreted proteins they encode. The products of the invention are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polymetries in a sample or by determining the presence of mutations in the new polymucleotides. Dased on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and fetal deficiencies, blood disorders, leukemias, diseases of the immune system, autoimmune diseases, hepatic and renal disease, schizophrenia, prostate allergies, Alzheimer's and cognitive disorders, pulmonary disorders, classed means asser, skebtatal or cardiac muscle disorders, pulmonary disorders, controlled the controlled the cardiac muscle disorders, pulmonary disorders, controlled the cardiac muscle disorders, pulmonary disorders, controlled the cardiac muscle disorders, pulmonary disorders, controlled the cardiac muscle disorders, pulmonary disorders, controlled the cardiac muscle disorders, pulmonary disorders, controlled the cardiac muscle disorders, pulmonary disorders, controlled the cardiac muscle disorders, pulmonary disorders, controlled the cardiac muscle disorders, pulmonary disorders, controlled the cardiac muscle disorders, pulmonary disorders, cardiac muscle disorders, pulmonary disorders, cardiac muscle disorders, pulmonary disorders, cardiac muscle disorders, pulmonary disorders, cardiac muscle disorders, pulmonary disorders, cardiac muscle disorders, pulmonary disorders, cardiac muscle disorders, pulmonary disorders, cardiac muscle disorders, cardiac muscle disorders, cardiac muscle disorders, cardiac muscle disorders, cardiac muscle disorders, cardiac muscle disorders, cardiac muscle disorders, cardiac muscle disorders, cardiac muscle disorders, cardiac muscle disorders cardiac muscle disord

The present sequence represents an immunisation motif normally excluded, but which may be used with advantage for tolerisation by itself or in conjunction with other epitope sequences from the present invention. The present invention describes a polypeptide comprising a human myelin basic protein (hMBP) fragment including P89-101 of hMBP, excluding native hMBP. The term P89-101 is not defined but may be intended to mean amino acids 89-101 of hMBP. The polypeptide can be used for tolerising a mammalian host immune system comprising and T cells to an immunogen of interest, wherein said immunogen is restricted by a transplantation antigen of said
                                                                                                                                                                             The inventors claim recombinant penicillin acyltransferase (PAT) and DNA coding for PAT. PAT catalyses the last step in the biosynthesis of penicillin G and penicillin V. More specifically, the coding strand of the DNA has the nucleotide sequence shown below. This includes three introns and codes for a PAT protein with mol. wt. ca. 40kD. Plasmid vectors pBC2001 and pBC2002 are specifically claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polypeptide comprising human myelin basic protein fragment - useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Myelin basic protein; immunity; immune response; neurological; T-cell; human; immunogen; B-cell; transplantation antigen; immunomodulator.
                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The peptide induces an autoimmune response (T cell) to a self-antigen (or part of it), and binds to an MHC (major histocompatibility complex) antigen of a host susceptible to autoimmune diseases, i.e. competes with binding to MBP and inhibit proliferation of MBP-reactive cells. The peptide has immunosuppressive and neuroprotective activity. This sequence represents a peptide derived from the human MBP protein which can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modulating or tolerizing the immune system, useful for treating multiple sclerosis, by administering a peptide derived from human myelin binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel method for modulating or tolerizing the

muclaic acid polymerase or aderivative nucleic acid polymerase with a muclaic acid polymerase or aderivative nucleic acid polymerase with a mutation that decreases 5-3' exonuclease activity or that reduces discrimination against dideoxynucleotide triphosphates. Also described:

(1) a vector comprising the nucleic acid (1); (2) a host cell comprising the nucleic acid (1); (3) a nucleic acid polymerase or its derivative; (4) a kit comprising a nucleic acid polymerase or its derivative; of (3); (5) making the nucleic acid polymerase of (3); (6) synthesising a DNA; (7) thermocyclic amplification of nucleic acid; and (8) primer amplification, reverse transcription, RNA amplification or primer extension reactions. The present sequence represents a Thermus oshimai nucleic acid polymerase peptide, which is given in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes an isolated nucleic acid (I) encoding a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid, useful for DNA sequencing or amplification, reverse transcription, RNA amplification or primer extension reactions.
                                                                                                                                                                                                            Thermus oshimai nucleic acid polymerase peptide 704-707 SEQ ID NO:26.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Description

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           US-08-456-424-124

Sequence 124, Application US/08456424

Sequence 124, Application US/08456424

Patent No. 5807979

PAPLICANT: SATTERTHWAIT JR., ARNOLD C.

APPLICANT: ARRHENIUS, THOMAS

APPLICANT: CABEZAS, EDELMIRA

TITLE OF INVENTION: SYMTHETIC, STABILIZED, THREE-DIMENSION

TITLE OF INVENTION: POLYPEPTIDES

NUMBER OF SEQUENCES: 145

CORRESPONDENCE ADDRESS:

ADDRESSE: MORRISON & FOERSTER

Patent No. 6245884

GENERAL INFORMATION:

APPLICANT: HOOK, VIVIAN Y.H.

TITLE OF INVENTION: SECRETASES RELATED TO ALZHEIMER'S DEMENTIA

TITLE OF INVENTION SECRETASES RELATED TO ALZHEIMER'S DEMENTIA

CURRENT APPLICATION NUMBER: US/09/173,887

CURRENT FILING DATE: 1998-10-16

SOFTWARE: PATENTIN Ver. 2.0

SEQ ID NO 3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Indels

Patent No. 6627409

GENERAL INFORMATION:

APPLICANT: HOOK, VIVIAN Y. H.

TITLE OF INVENTION: SECRETASES RELATED TO ALZHEIMER'S DEMENTIA

FILE REFERENCE: P-AS 4579

CURRENT APPLICATION NUMBER: US/09/797,543

CURRENT FILING DATE: 2001-05-29

PRIOR PLING DATE: 1998-10-16

NUMBER OF SEQ ID NOS: 5

SOFTWARE: Patentin Ver. 2.0

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

T-cell receptor gamma chain (2t.23) - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Accession: G41946
R;Whetsell, M.; Mosley, R.L.; Whetsell, L.; Schaefer, F.V.; Miller, K.S.; Klein, J.R.
Mol. Cell. Biol. 11, 5902-5909, 1991
A;Title: Rearrangement and junctional-site sequence analyses of T-cell receptor gamma ger A;Reference number: A41946; MUID:92049316; PMID:1658619
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            hypothetical protein 22947 [imported] - Escherichia coli (strain 0157:H7, substrain EDL93

T-cell receptor gamma chain (5t.12) - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Date: 03-Feb-1994 #sequence_revision 03-Feb-1994 #text_change 07-May-1999
C;Accession: H41946
Mol. Cell. Biol. 11, 5902-5909, 1991
A;Ritle: Rearrangement and junctional-site sequence analyses of T-cell receptor gamma ge A;Receronce number: A41946; MUID:92049316; PMID:1658619
A;Receron: H41946
A;Status: preliminary; not compared with conceptual translation
A;Molecule type: DNA
A;Residues: 1-12 < WHE>
C;Keywords: T-cell receptor
Eur. J. Biochem. 231, 742-746, 1995
A;Title: A Rhizobium meliloti ferredoxin (FdxN) purified from Escherichia coli donates A;Title: A Rhizobium meliloti ferredoxin (FdxN) purified from Escherichia coli donates A;Accession: S66458
A;Accession: S66458
A;Status: preliminary
A;Molecule type: protein
A;Residues: 1-10 <RIE>
C;Genetics:
A;Gene: fdxN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0

It on exo-alpha-1,4-glucosidase, and its striking similarity to bacillary oligo-1,6-glucosidases in N-terminal sequence and in structural parameters calculated from the amino acid
-i- FUNCTION: Strong inhibitor of fluid secretion by the Malpighian tubules. Uses CGMP as a second messenger and inhibits fluid production by decreasing cAMP concentration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  16-0CT-2001 (Rel: 40, Created)

J. Biochem. 205:249-256(1992).
-!- CATALYTIC ACTIVITY: Hydrolysis of terminal, non-reducing 1,4-
linked D-glucose residues with release of D-glucose.
-!- SIMILARITY: Belongs to family 13 of glycosyl hydrolases.
PIR; S21240; S21240.
Hydrolase; Glycosidase.
                                                                                                    -!- SUBCELLULAR LOCATION: Secreted.
-!- MASS SPECTROMEREX: MW=1541.58; METHOD=MALDI.
-!- SIMILARITY: STRONG, TO THE C-TERMINAL OF T.MOLITOR CUTICULAR
PROTEIN LPCP29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .;

"Isolation and sequencing of five variants of phospholipase A2
from women of snake Trimeresurus stejnegeri.";
J. Hubei Univ. 25:63-68(2003)
-!- FUNCTION: PA2 catalyzes the calcium-dependent hydrolysis of the 2-
acyl groups in 3-sn-phosphoglycerides.
-!- CATALYTIC ACTIVITY: Phosphatidylcholine + H(2)0 = 1-
acylglycerophosphocholine + a fatty acid anion.
-!- COPACTOR: Binds I calcium ion per subunit (By similarity).
-!- SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eigenheer R.A., Wiehart U.M., Nicolson S.W., Schoofs L., Schegg K.M., Hull J.J., Schooley D.A.;
"Isolation, identification and localization of a second beetle antidiuretic peptide.";
Peptides 24:27-34 (2003).
-I- FUNCTION: Inhibitor of fluid secretion by Malpighian tubules. Uses CAMP as second messenger. May function as an antidiuretic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TISSUE SPECIFICITY: Brain. Appears to be mainly expressed in two pairs of bilaterally symmetrical cells in the protocerebrum. MASS SPECTROMETRY: MW=1560.33; METHOD=MALDI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                 -!- TISSUE SPECIFICITY: Expressed by the venom gland.
-!- SIMILARITY: Belongs to the phospholipase A2 family. Group II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Millar A.H., Knorpp C., Leaver C.J., Hill S.A.;
"Plant mitochondrial pyruvate dehydrogenase complex: purification and identification of catalytic components in potato.";
Biochem. J. 334:571-576 (1998).
-!- FUNCTION: The pyruvate dehydrogenase complex catalyzes the overall conversion of pyruvate to acetyl-CoA and CO(2). It contains multiple copies of three enzymatic components: pyruvate dehydrogenase (E1), dihydrolipoamide acetyltransferase (E2) and lipoamide dehydrogenase (E3).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

-!- CATALYTIC ACTIVITY: Isocitrate = succinate + glyoxylate.
-!- PATHWAY: Glyoxylate bypass; first step.
-!- SUBJWIT: Homotetramer (By similarity).
-!- SUBJWIT: BOOCATION: Cytoplasmic.
-!- SUBILARITY: Belongs to the isocitrate lyase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             / Match 21.7%; Score 18; DB 1; Length 15; Local Similarity 75.0%; Pred. -!- FUNCTION: This protein is one of the nuclear-coded polypeptide chains of cytochrome coxidase, the terminal oxidase in mitochondrial electron transport.
-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sex pheromone cPD1.

"Postsynaptic short-chain neurotoxins from Pseudonaja textilis: cDNA
T. aloning, expression and protein characterization.";

Bur. J. Blochem. 265-982-989(1999)

-!- FUNCTION: Lethal neurotoxin, binds and inhibits nicotinic
acetylcholine receptors (nAchR).

-!- TISSUE SPECIFICITY: Expressed by the venom gland.
-!- TASSUE SPECIFICITY: Expressed by the venom gland.
-!- MASS SPECIFICITY: Expressed by intravenous injection.
-!- MASS SPECIFICITY: Expressed by intravenous injection.
-!- SIMILARITY: Belongs to the snake toxin family.

      TITLE OF INVENTION:

TITLE OF INVENTION:

FILL REPERENCE: REH-2013

CURRENT APPLICATION NUMBER: US/10/245,871

CURRENT PILING DATE: 2003-01-09

PRIOR APPLICATION NUMBER: 09/396,813

PRIOR APPLICATION NUMBER: 09/396,813

PRIOR APPLICATION NUMBER: 09/396,813

PRIOR FILING DATE: 1999-09-14

NUMBER OF SEQ ID NOS: 905

SOFTWARE: PARENTIN Ver. 2.1

SEQ ID NO 501
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FEATURE: OTHER INFORMATION: Description of Artificial Sequence: Synthetic OTHER INFORMATION: Ii-key/tyrosinase overlapping hybrid peptide

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 190
